

Reference-wise Justification and Relation to Project

[1] Algorithmic Bias in Automated Hiring Systems

This paper discusses how automated hiring systems can introduce bias if not carefully designed. It motivates the need for explainable and controlled recruitment systems. Our work addresses these concerns through deterministic rule-based screening and recruiter-controlled decision making.

[2] Bias Risks in AI-Driven Employment Decision Making

This study provides ethical and legal perspectives on AI usage in hiring. It supports our design choice of keeping humans in control and avoiding fully autonomous decision making.

[3] Context-Aware Resume Entity Extraction Using Deep NLP Models

This work presents advanced NLP-based resume parsing techniques. It provides background for resume skill extraction which our system implements using a transparent deterministic approach.

[4] Fairness Metrics in Machine-Assisted Recruitment Systems

This paper introduces fairness-aware evaluation concepts. It supports our use of multi-factor evaluation instead of single-signal decision making.

[5] Evaluating Objectivity in Automated Candidate Scoring

This study examines objectivity in automated scoring systems. Our unified weighted scoring engine aligns directly with these principles.

[6] Transformer-Based Resume Named Entity Recognition Benchmarking

This paper represents advanced transformer-based approaches. It is used to justify why our system adopts a hybrid model rather than full dependence on deep learning.

[7] Resume Parsing Using Machine Learning Models

This reference provides an overview of ML-based resume parsing. It is used for comparison with our deterministic and explainable parsing logic.

[8] Semantic Relation Extraction for Professional Profiles

This work focuses on understanding relationships between skills. It supports our related-skill and cluster-based matching logic.

[9] Automated Interview Assessment Using Behavioral and Speech Features

This paper discusses automated interview analysis. It is cited to clarify that our system avoids behavioral prediction and uses structured interview prompts instead.

[10] Validity and Bias in Automated Video Interview Assessment

This study highlights bias risks in video-based interview systems. It justifies our decision to avoid emotion detection or facial analysis.

[11] Secure Containerized Execution for Remote Coding Evaluation

This work explains secure execution of coding assessments. It supports our conditional coding assessment design.

[12] AI-Assisted Code Review and Quality Metrics

This paper discusses structured evaluation of code quality. It supports the inclusion of objective technical assessment criteria.

[13] AI-Powered Automated Resume Screening and Job Matching System Using NLP

This reference represents common AI-driven screening systems. It is used as a baseline comparison for our unified approach.

[14] A Review of Applicant Tracking Systems and Recruitment Automation

This survey highlights limitations of traditional ATS systems. It motivates the need for unified and transparent recruitment workflows.

[15] Resume2Vec Transformer-Based Matching

This paper introduces semantic matching using transformers. It motivates our ML-based ranking refinement while keeping rule-based eligibility intact.

[16] Fairness in AI-Driven Recruitment: Challenges and Metrics

This work provides an overview of fairness challenges. It supports our ethical design considerations.

[17] Intelligent AI-Based Resume Screening and Ranking Framework

This paper presents scalable AI recruitment systems. It is used to compare scalability and architectural design.

[18] Enhancing Intelligent Recruitment Systems Using Hybrid ML Models

This work closely aligns with our hybrid rule-based and ML-enhanced ranking architecture.
