

How the Proposed UTAP Model Differs from Present-Day Recruitment Systems

1. Introduction

Most present-day recruitment platforms focus on resume collection and manual screening, which leads to bias, delays, and inconsistent hiring decisions. The proposed UTAP model improves this process by introducing structured screening, self-designed algorithms, and transparent scoring while maintaining realism and ethical boundaries.

2. Present-Day Recruitment Model

- Candidates upload resumes and wait for manual shortlisting.
- Recruiters rely heavily on resumes, keywords, or referrals.
- Assessments are often external or inconsistent.
- No unified scoring across resume, assessment, and interview.
- Bias can occur due to college, background, or resume formatting.
- Candidates rarely get clear status updates.

3. Proposed UTAP Recruitment Model

- Structured recruiter and candidate portals with clear role separation.
- Custom resume skill extraction and job-skill matching algorithms.
- Mandatory and optional skill classification for realistic filtering.
- Conditional assessments (MCQ, coding) based on job configuration.
- Short AI-assisted interview for communication evaluation.
- Unified weighted scoring and transparent candidate ranking.
- Clear application status tracking for candidates.

4. Key Differences

Automation vs Manual Screening: UTAP automates early-stage screening using algorithms, whereas present systems rely on manual filtering.

Skill-Based Evaluation: UTAP evaluates candidates on actual skills instead of resume appearance or background.

Unified Scoring: UTAP combines multiple evaluation stages into a single transparent score.

Fairness & Bias Reduction: UTAP minimizes human bias through structured rules and normalization.

Recruiter Flexibility: UTAP allows recruiters to use platform-generated or their own assessments.

5. Advantages of the Proposed Model

- Faster and more consistent candidate screening.
- Improved hiring fairness and transparency.
- Better candidate experience through status visibility.
- Reduced recruiter workload in early screening stages.
- Configurable assessment and scoring aligned with company needs.
- Scalable architecture suitable for different job roles.

6. Why This Model Should Be Used

The UTAP model bridges the gap between traditional recruitment platforms and modern intelligent hiring systems. It offers automation without removing human control, fairness without losing flexibility, and intelligence without excessive complexity. This makes it suitable for real-world adoption as well as academic implementation.

7. Conclusion

The proposed UTAP model improves upon existing recruitment systems by introducing structured workflows, algorithm-driven screening, and unified scoring. It represents a practical, fair, and scalable improvement over present-day recruitment practices while remaining explainable and ethically sound.
